

Our services consist of multi-disciplinary geosciences consultancy with decades of experience across the oil and gas field life cycle, in exploration, appraisal and development

-  Support all life cycles phases of an asset from exploration and prospect generation
-  Characterization and identification of full potential of shale and gas tight reservoirs
-  Detailed stratigraphic and sedimentological frameworks definition

-  Volumetric assessment and hydrocarbon-in-place calculation
-  Well log correlations and petrophysical analysis
-  Geological database well creation, consolidation and management
-  Onsite well control while drilling

-  Micropaleontological analysis (forams and palynology)

-  Geological prognosis and drilling planning

-  Integrate seismic interpretation (Amplitude, Coherence, Attributes, Inversion, and AVO), petrophysical and production data to identify drilling opportunities

-  Well seismic ties/ Synthetic Seismograms/ Depth Conversion/ Velocity Models

-  Subsurface Mapping
-  Seismic acquisition planning and reprocessing
-  Prospect evaluations and assignment of geological risk to plays

- Integration of core description, SEM, XRD and Petrophysical data for conventional and unconventional reservoir modeling
- Geomodelling capabilities allows to geostatistically capture and validate static reservoir properties useful for numerical simulation and uncertainty analysis

- Parallel FEM code developed and tested, coupling examples have demonstrated its suitability to handle geomechanical problems
- Developed new algorithms to reconstruct reservoir geometry applied to real datasets

Molecular Characterization of Crude Oils and their Fractions

Chemical and Physical Properties

Environmental Analysis

Spectroscopic and Chemical Analysis

- Trace S and N in Ambient Air and produced waters (UV Fluorescence, Chemiluminescence)
- Trace Hydrocarbons in Air and Produced Waters (Laser Induced Fluorescence, MS, GC and GC-MS)

We provide a comprehensive reservoir engineering services oriented to increase asset value and optimize field development and planning

- Optimization of EOR and implement adequate reservoir management strategy to maximize sweep efficiency and optimize development aligned with the field development plan to maximize ultimate recovery

- Experimental design and analysis of static and core-flooding laboratory test for Waterflooding and EOR (Chemical flooding process, Alkaline, Polymer, Surfactants)

- Numerical Reservoir Simulation support for Thermal EOR projects, steam injection, steam/solvent hybrid process

- Reservoir Characterization Validation and Integration

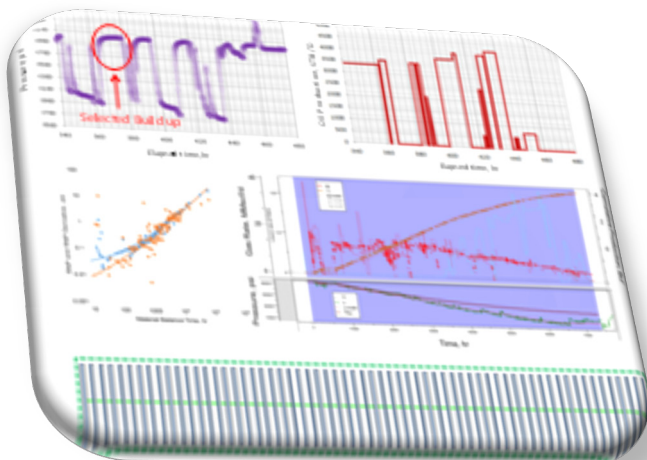

- Heavy Oil Exploitation

- History Matching

- Identify potential infill drilling and recognize bypassed hydrocarbons

- Delineate solutions for improving field recovery efficiency

- Production optimization by identified adequate remedial work to optimize reservoir performance

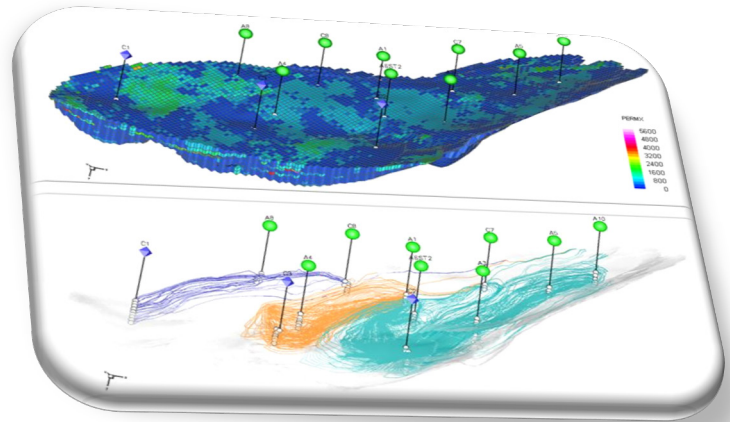

- Conventional and Unconventional well testing and production analysis

- Pressure Transient Analysis

- Material Balance calculation

- Advanced Decline Curve Analysis

- Specialized reservoir studies for hydraulic and thermal fracture modeling
- Design, monitoring, and interpretation of tracers injection program
- Tracking fluids movement, identifying injector/producer communication, and assessing reservoir heterogeneities from tracers results

- Integrated **3S** (Surface-Subsea-Subsurface) flow model in Waterflooding projects, allowing to evaluate injectivity index, pressure and injection rate required by the water injection system during design phase
- Estimation and evaluation of reserves, incorporating field potential analysis

- Support of integrated field development plans with focus on: Risk and Uncertainty Analysis, Appraisal Planning, Screening and Ranking of Development Options, and Economic Modeling

- Reservoir Development Plan optimized by economic criteria to maximize profits

- Advanced reservoir management tools aligned with business strategy: Risks quantification, Decision trees implementation, Identification of operational scenarios, and development options ranking

- Committed to deliver timely and quality solutions to maximize the commercial value of the asset

We are fully equipped with the required skills and technology to conduct any type of prospect economic evaluation for the oil and gas

- Development of economic models to determine the operating life of a project (or well) and future performance prediction
- Oil and gas property evaluation: Reporting data required to structure a deal, Investment value, and Half-life project estimation
- Capabilities available to deploy on any exploration or production project, minimizing risk of failure, and delivering a high quality product

- Management of Workover and Completion for new drills, recompletions, and remedial operations with Well Site support experience

- Directional Drilling, MWD/LWD, Mud Engineering, Cementing, Frac/Stimulation, and Completions in Unconventional, Conventional, and Deepwater projects

- Monitoring critical operations on workover rigs and rigless operations, ensuring conformance to all applicable rules and regulations, as well as meeting HES requirements.

- Reconfiguration of Artificial lift systems, plug back, completion operations on new drills, as well as numerous rod, pump, tubing and casing failures

- Procedures development for: workover/recompletion, liner installation, conversion from producer to injector, re-instatement of T/A'd injectors and producers, Commingling zones, Surface Casing leaks, H-5 failures

- Data Integration for Reservoirs: Different data sources scan different length scales of heterogeneity and can have different degrees of precision

- State of the art tools for Competitor analysis evaluation: Detailed comparison by common trends, and parameters to support adjusting energy portfolio accounting for reserves depletion and market behavior
